1. Go into git bash
2. Make sure you are in the exact location of the .java file
   - Do that by command: cd ==C:\Users\Administrator\Object Oriented Programming\SilentSymbols\src== (edit it to your path of where the file is located on computer, make sure you are in the src folder or it wont work properly.)
3. If you already have a .class folder, delete it
4. Run this command, fixing the paths to your specific paths: javac --module-path ==C:\Users\Administrator\Object Oriented Programming\javafx-sdk-24\lib== --add-modules javafx.controls "src\SilentSymbols.java"
   - The highlighted stuff is what needs to be edited
   - This will make the new class file, you can ignore that basically
5. Run this command, making sure the paths are accurate: java --module-path ==C:\Users\Administrator\Object Oriented Programming\javafx-sdk-24\lib== --add-modules javafx.controls -cp "src;resources" SilentSymbols
   - The silent Symbols shouldn't need to be changed as long as that's the name of the file
6. That should run it correctly, hopefully
